

A Core-field extrapolation: network extension without added advantage

Test design

Predict seizure energy at held-out hidden contacts

○ core contacts ■ held-out hidden contacts

Metric: median per-seizure |Spearman| on hidden contacts

B

Cohort decision: which predictor wins?

Subject-level winner; tie if |score difference| ≤ 0.03

own order wins

tie

core field wins

Broadband

drop low-count subjects: core 7 / own 5 / tie 2

HFA

drop low-count subjects: core 5 / own 7 / tie 2

Result: wins split across subjects; core-field extrapolation is not systematically better.

C

What can we claim?

PASS

Network extension

Core field predicts hidden seizure-energy territory
Broadband 9/16, HFA 9/16; both $q < 1e-4$

LIMITED

Subject-level robustness

All three nulls pass in fewer subjects
Broadband 5/16, HFA 2/16

NO

Added advantage over own order

Core field does not beat the hidden contacts' own order
Broadband $q=0.32$, HFA $q=0.79$
