

Core A and B: two spatial populations

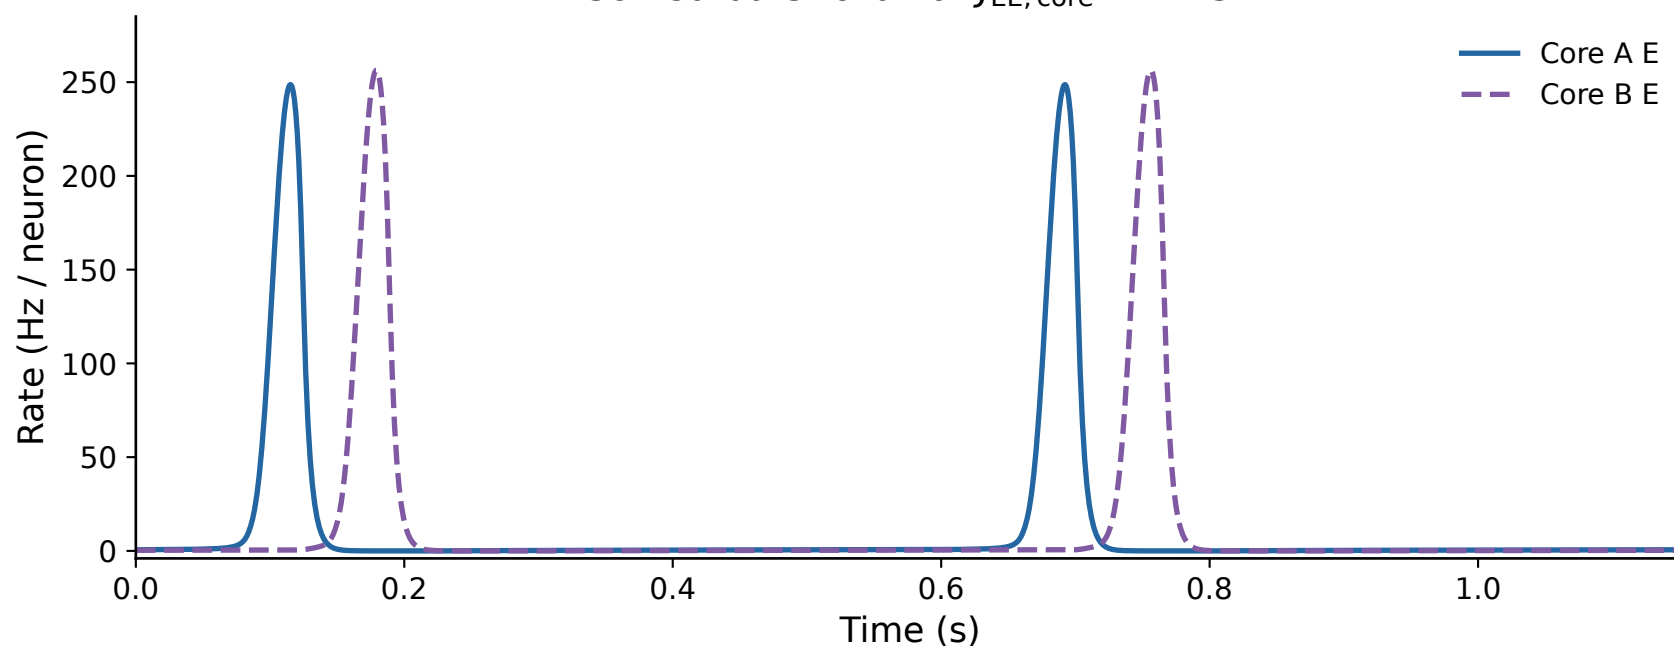

No direct A↔B edges in this realized graph

$J_{EE, \text{core}}$ scales local E→E

$J_{EE, \text{core}}$ scales local E→E

Solved burst orbit at $J_{EE, \text{core}} = 1.15$

Full-network period: 577.009 ms. B peak follows A peak by 63.96 ms on this orbit.

The fold mode begins in A; the later burst recruits both cores. A/B are spatial identities, not state labels.
