

Inhibitory reserve requires a two-dimensional q-A safe corridor

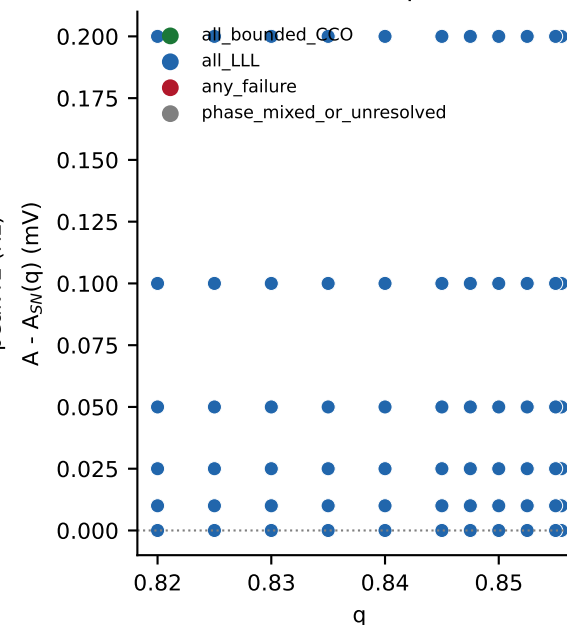

A Failure is aligned to a 2D q-A fold

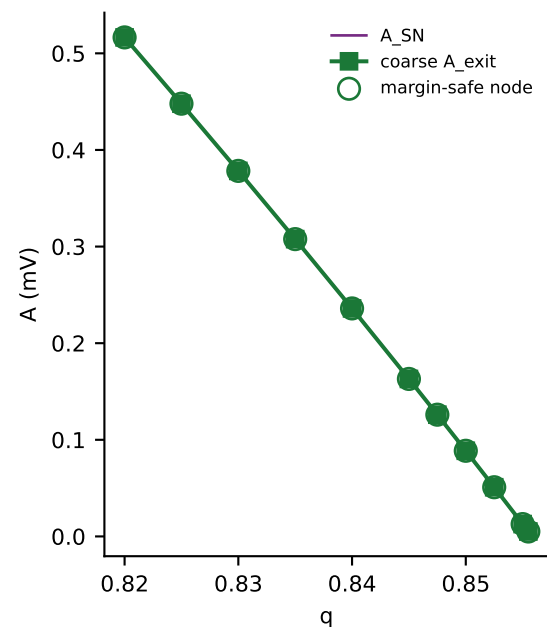

B A=0 established CCO remains bounded

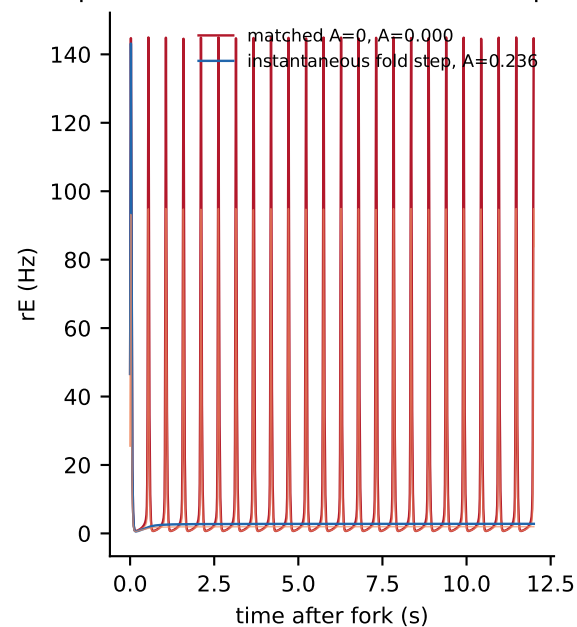

C Instantaneous A steps all reach LLL

D Coarse safe exit fibers

E Representative event-locked fork at q=0.8400

F R0a mechanistic verdict

q nodes tested: 11; phases: 4; dt: 0.125 ms
bounded A=0 source nodes: 11/11
margin-safe coarse fibers: 11/11
safe q nodes: [0.8555, 0.855, 0.8525, 0.85, 0.8475, 0.845, 0.84, 0.835, 0.83, 0.825, 0.82]

R0a is discovery only.
R0b must add midpoint q nodes, half dt,
smooth occupancy-gated M ramp, threshold
refinement, and recovery forks.

No q_{res} dynamics or E-to-E changes were run.
