

Topic 4 — state-conditioned spatial susceptibility along the MZ z-depletion trajectory (candidate zA_q50_tz10000; static state maps; model-side diagnostic, NOT a seizure)

eigenmode (asymptotic mode) / V1 (optimal finite-time input) / U1 (optimal output) / G (probe scan) are DISTINCT objects. $k_{||}/k_{\perp}$ = input WAVEVECTOR direction (not propagation). onset = unresolved equilibrium boundary (omitted). Propagation DYNAMICS are in the separate time_response figure (fixed-kick $\sigma_1(T)$ + evolution + kymograph). peak_k rail-limited (low-k = whole-sheet; see convergence figure).
